

Oil-booming at a river

Land Disaster Safety Service (LDSS)

LDSS is an incident response service for inland petrochemical factories. If HM spill and fire occur at an inland factory, the spill immediately spreads through trenches, roads, rivers. In that case, the spill may generate health and environmental impact at totally different locations from the source of spill. MDPC has made a standby contract with the inland petrochemical facilities and provides not only an incident response service but also HM trainings for the facility workers in times of peace.
